# Lab No. 01:

# Selective Coloring Using Brush Tool in Photoshop

## Objective

To convert a color image into black & white and restore color in selected parts using the **Brush Tool and Layer Mask** in Adobe Photoshop.

## Theory

Selective coloring is a photo editing technique in Photoshop where most of the image is converted into black & white, while a selected object remains in full color.
This is done using **Adjustment Layers, Layer Masks, and Brush Tool**. The Brush Tool is used to manually reveal or hide parts of the image by painting on the mask.

- **Black color on mask = hides effect (shows color)**
- **White color on mask = shows effect (black & white)**

## Tools Used

- Adobe Photoshop
- Brush Tool (B)
- Quick Selection Tool
- Layer Mask
- Black & White Adjustment Layer

## Procedure

### Step 1: Open Image

1. Open Adobe Photoshop.
2. Import a color image.

### Step 2: Selection of Object

1. Select **Quick Selection Tool (W)**.
2. Carefully select the object you want to keep in color.

### Step 3: Apply Layer Mask

1. Go to **Adjustments Panel**.
2. Add **Black & White Adjustment Layer**.
3. Click on **Layer Mask icon** to apply mask.

## Step 4: Apply Black & White Effect

1. The whole image becomes black & white.
2. Make sure mask is selected.

## Step 5: Use Brush Tool

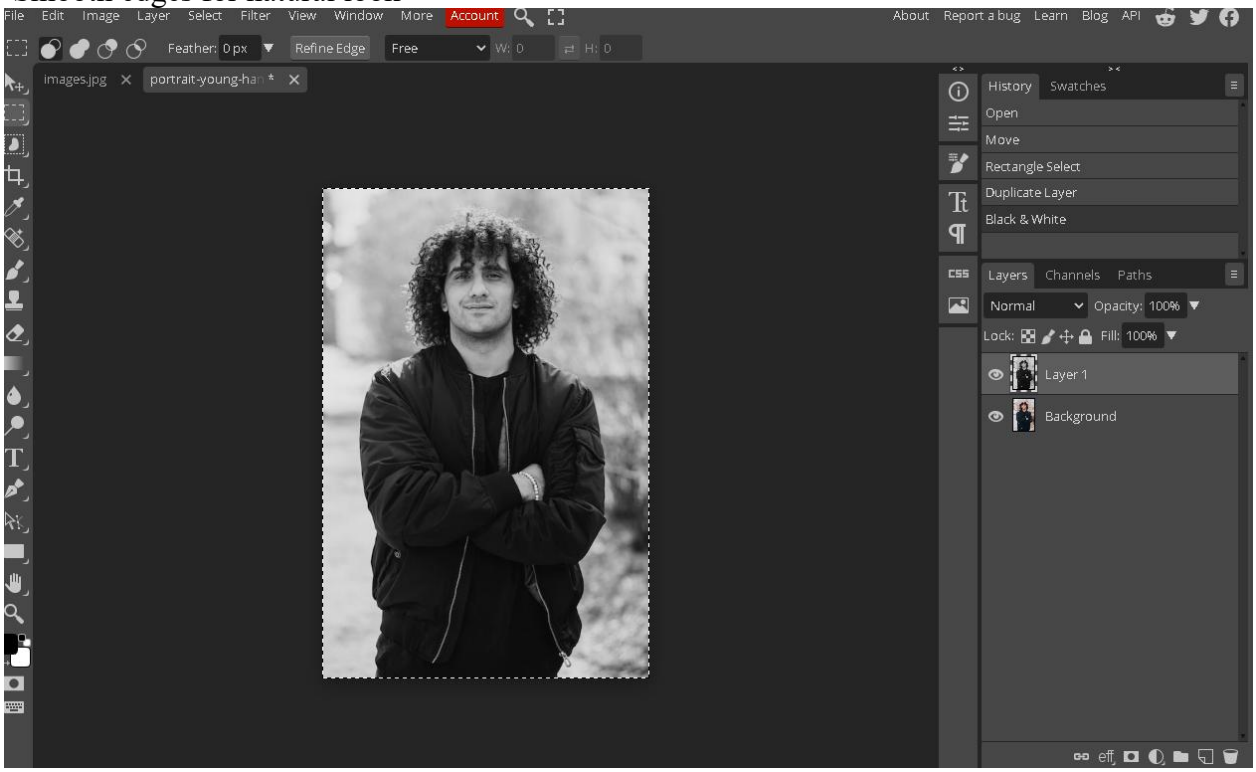

1. Select **Brush Tool (B)**.
2. Set foreground color to **Black**.
3. Zoom in for accuracy.
4. Paint over the selected object to bring back original color.

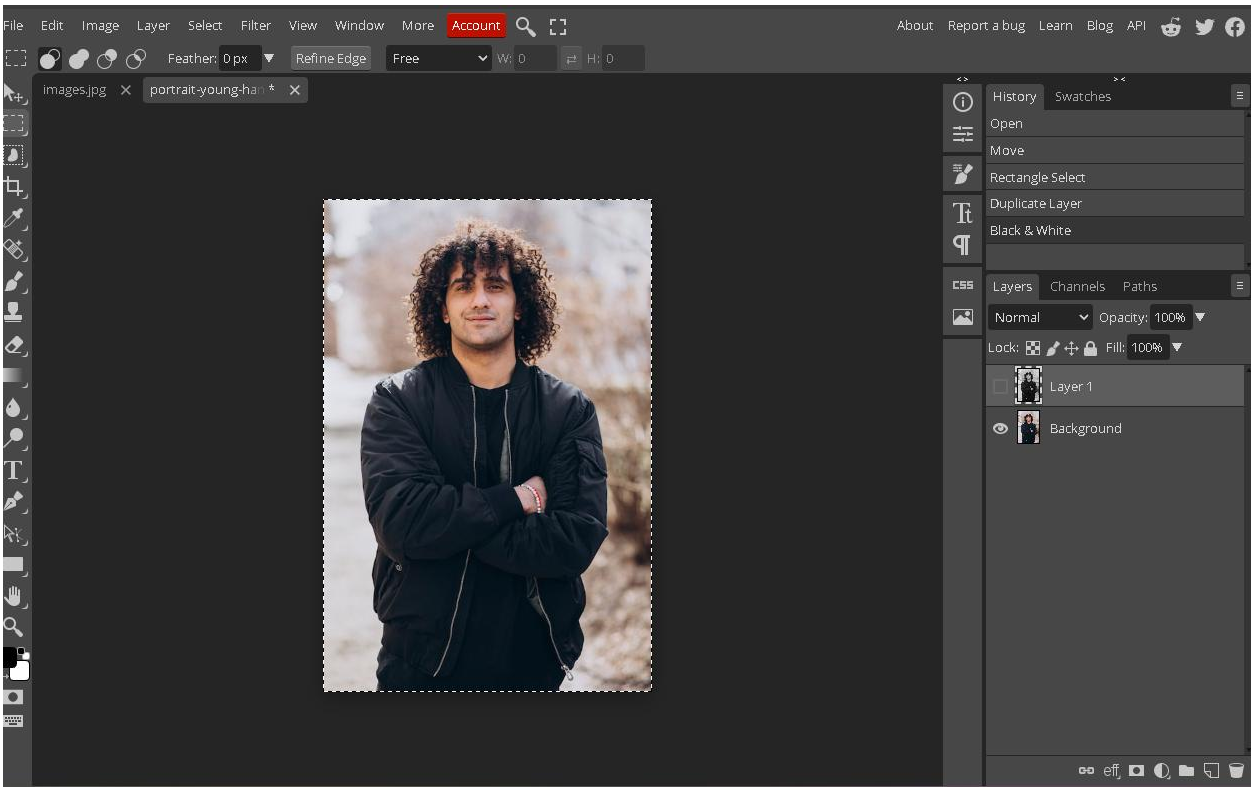

If mistake happens:

- Use **White color brush** to fix it back.

## Step 6: Final Adjustments

1. Adjust brush size and hardness.
2. Smooth edges for natural look

# Result

The image is successfully converted into black & white while the selected object is restored in full color using the Brush Tool and Layer Mask technique.

# Conclusion

In this lab, we learned how to create a selective coloring effect using Brush Tool and Layer Mask in Photoshop. This technique is widely used in professional photo editing for highlighting specific subjects.
