COMP 324: Network Administrator

Lab#1

Muhammad Usman Shaikh-005

- **Objective**: The Control Panel Is Part of The Microsoft Windows:

Theory:

- Which allow users to view and manipulate basic system settings and user control of software and hardware features.
- These are the following components which mostly found in the windows platform.

1. **Programs And Features**
2. **Date And Time**
3. **System**
4. **Windows Firewall**
5. **Bit locker Device Encryption**
6. **Administrative Tool**
7. **Backup And Restore**
8. **Personalization**
9. **Display**
10. **Device And Printer**

Component Descriptions:

1. Program and Features:

This component allows users to install, uninstall, change, or repair software applications and Windows features. It provides a centralized list of all installed programs, showing details such as the publisher, installation date, and file size, helping users manage disk space and remove unwanted or legacy software safely.

Network Administrator

2. Date and Time:

This utility enables users to view and modify the system clock, time zone, and date settings. It also allows synchronization with internet time servers to ensure system accuracy and configure secondary or custom time zones for scheduling and global communication.

3. System:

This utility provides a comprehensive overview of the computer's core hardware specifications and operating system details. It displays essential information such as the processor (CPU) model, installed RAM, system type (32-bit or 64-bit operating system), Windows edition, and computer name. It also provides quick access to advanced system settings like device manager, remote settings, and system protection.

4. Windows Firewall:

A security component that monitors and filters incoming and outgoing network traffic based on predetermined security rules. It acts as a protective barrier between the internal computer system and trusted or untrusted external networks (like the internet) to block unauthorized access and malicious threats.

Network Administrator

5. BitLocker Device Encryption:

built-in data protection feature that encrypts entire storage drives (operating system and fixed/removable data drives) to secure data against theft, unauthorized access, or physical loss. It uses advanced encryption algorithms (such as AES) and requires authentication keys (like a PIN or recovery key) at startup.

6. **Administrative Tools:**

A collection of advanced tools and utilities designed for system administrators and advanced users. It includes applications like
Computer Management, Event Viewer, Defragment and Optimize Drives, and Services, which are used for monitoring system performance, managing storage, troubleshooting errors, and configuring deep system settings.

7. **Backup and Restore:**

A utility that allows users to create backup copies of essential system files, personal folders, or create full system image backups. It enables users to restore their data or recover the operating system in the event of hardware failure, file corruption, or accidental deletion.

Network Administrator

8. **Personalization:**

settings category that lets users customize the graphical user interface and visual appearance of the Windows operating system. Users can change desktop backgrounds, window colors, screen savers, themes, lock screen images, and taskbar behaviors to suit their preferences.

9. **Display:**

This option manages visual output settings for connected monitors and displays. Users can adjust screen resolution, orientation, multiple-display arrangements (extend or duplicate), brightness, and scaling settings to optimize text legibility and image clarity.

10. **Device and Printer:**

control hub that displays all hardware peripherals connected to the computer, such as printers, scanners, keyboards, mice, and external drives. It allows users to add new devices, view device statuses, update or reinstall drivers, troubleshoot hardware connection issues, and manage default printing preferences.
